Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1905 Excerpt: .easily find a plan of distribution in which the effects of practice are properly compensated. At the conclusion of the experiment, E sorts out the 200 results into two groups of 100 each, which he arranges in columns under the rubrics / (rt to the left) and II (rl to the right of r). The values  $r_m$ ,  $e_m$  and  $c$  are to be determined separately for each group of 100 determinations. We have said that the value  $e_m$  is the most characteristic test-value furnished by the method. We shall want, then, to determine  $e_m$  as accurately as possible. Now in any given setting of  $r$ , the error  $e$  is algebraically added to a constant error  $c$ . But a constant error is simply an error whose conditions are constant; its amount may vary, quite considerably, from stage to stage of a long series of experiments. If our own constant error  $c$  has varied in this way, its variation must evidently have affected the value of  $e_m$  as determined above. To free  $e_m$  of any influence of this sort, we must fractionate the results. We determine  $Z_e$ , not for the whole group of 100 observations, but for quarter-groups of 25 observations apiece; and we determine  $e_m$ , not as., but as 100 This value is more accurate than the value On the other hand, it is 100 indifferent for the determination of the  $c$  of each group whether we work from the group as a whole, or separately from...
